Development Environment

1) Backend (JAVA)

- Java Development Kit (JDK) : Version 1.8
- Integrated Development Environment (IDE) : IntelliJ IDEA
- Build Tool : Maven
- Spring Boot (Optional) : 2.3.12.RELEASE
- Database : Oracle DB
- Endpoints : HTTP RESTful APIs
- Documentation : Spring Doc (Swagger 3)
- Security : Spring Security + Dubai Police LDAP

Artificial Intelligence الذكاء الاصطناعي

Database Schema Overview

1) Challenges

- Represents a challenge/question in the system.
- Contains various attributes such as topic classification, decision levels, impact, etc.
- Relates to other entities like Strategic Goals, Strategic Direction, User, User Invitation, Chat Room, Library, Solution, Challenge Hashtag, Challenge Video, Challenge Documents, Challenge Reminder, Validators, and more.

2) Challenge Documents

- Represents documents associated with a challenge.
- Stores the document's name, path, type, and the actual document file.

3) Challenge Expertises

- Represents the relationship between challenges and expertises.
- Indicates the level of expertise a user has for a specific challenge.

4) Challenge Hashtag

- Represents the relationship between challenges and hashtags.
- Associates challenges with specific hashtags.

Database Schema Overview

5) **Challenge Reminder**
   - Stores reminders associated with challenges.
6) **Challenge Settings**
   - Stores various settings related to challenges.
7) **Challenge Video**
   - Represents videos associated with challenges.
8) **Hashtag**
   - Represents hashtags that can be associated with challenges.
9) **Chat Members, Chat Messages, Chat Room**
   - Represent a chat system associated with challenges.
10) **Solution, Solution Comment**
   - Store solutions and comments associated with challenges.

Artificial Intelligence الذكاء الاصطناعي

DUBAI POLICE

Database Schema Overview

11) Strategic Direction, Strategic Goals, Strategic Goal Direction

- Define the strategic goals and directions associated with challenges.

12) User

- Represents users who can be moderators, validators, or participants in challenges.

13) Roles

- Defines user roles with associated permissions.

14) Expertises, Users Expertises

- Define areas of expertise and the relationship between users and their expertises.

15) Validators

- Represents users invited as validators for challenges.

16) Voting

- Stores information about user voting on solutions.

Artificial Intelligence الذكاء الاصطناعي
Department الإدارة العامة

شرطة دبي
DUBAI POLICE

Database Schema Overview

17) **Tweets**
    - Represents tweets associated with challenges.
18) **Library**
    - Represents and Stores documents in a library associated with challenges.
19) **Designation**
    - Defines various designations and their types.
20) **Comment Reply**
    - Represents replies to solution comments.

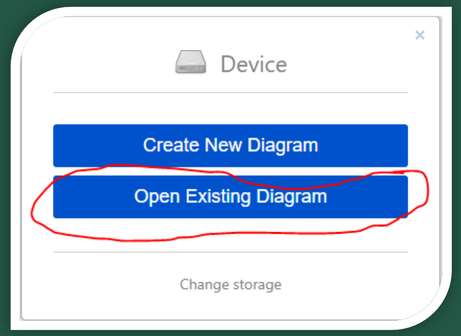

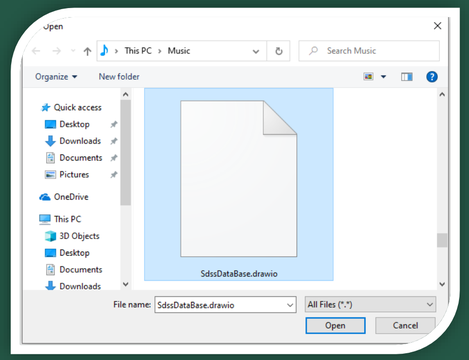

Artificial Intelligence الذكاء الاصطناعي
Department الإدارة العامة

شرطة دبي
DUBAI POLICE

Database ERD Schema

1) **Access Google Drive**
   - Go to Google Drive ERD Schema Folder.
2) **Download ERD Schema File:**
   - Download the ERD schema file from the Google Drive folder.
19) **Open Draw.io**
   - Visit Draw.io.
20) **Load Existing File**
   - Click on "Open Existing File" in Draw.io.
   - Choose the downloaded ERD schema file from your device.

- Standard naming conventions for package names.
- Establishing a standardized and reusable codebase.

Establishing a standardized and reusable codebase is crucial for the seamless development of various projects within Dubai Police services. To achieve this, we propose the creation of a dedicated "Common" package. This package will serve as a centralized repository for shared code, fostering consistency, efficiency, and best practices across all Dubai Police services. By encapsulating commonly used functionalities and utilities in this package, developers can easily leverage and integrate these components into their projects, promoting uniformity and minimizing redundant efforts. This systematic approach enhances collaboration, simplifies maintenance, and ensures that future services adhere to the established coding standards.

Code Snippets

Admin User

Add Admin User

- The Add Admin User method is responsible for adding a new admin user to the system.
- It performs validation of the incoming Create Admin User Request and checks if the specified username or email is already in use.
- Creates a new User entity with the provided details, including username and email.
- Sets the user status to "ACTIVE" and assigns the roles and expertise to the user.
- Saves the new admin user to the database.
- Sends a welcome email to the new admin user.
- Returns a User Response object containing information about the added admin user.

Validation:

- The Validate Admin User Request method performs custom validation logic for admin user creation. It may include checks for email format, or other specific requirements.

- Check for Existing User:
- The check If Username Or Email Exists method checks if the specified username or email is already in use by querying the database. If either exists, it throws a User Already Exists Exception.

Sending Welcome Email:

- The Send Welcome Invitation Email method sends a welcome email to the new admin user using the Email Sender. It includes a subject, recipient email, user details in the model, and a template name.

```
1 usage  Mohammed Abdu
@Override
@Transactional
public UserResponse addAdminUser(CreateAdminUserRequest request, MultipartFile profileImage) {
    User mappedUser = this.handleUserInitInformationBeforeActivation(request, profileImage);
    User savedUser = userRepository.save(mappedUser);
    this.handleUserExpertises(request, savedUser);
    this.sendInvitationForCreatedUser(savedUser, request);
    UserResponse response = this.prepareUserResponse(savedUser);
    response.setConfirmationUrl(this.generateConfirmationURL(savedUser, request));
    return response;
}
```

```
1 usage  Mohammed Abdu
private User handleUserInitInformationBeforeActivation(CreateAdminUserRequest request, MultipartFile profileImage) {
    User user = modelMapper.map(request, User.class);
    EmployeeGrpResponse employeeByGrp = coreClientService.findEmployeeByGrp(request.getGrpNumber());
    if (Objects.nonNull(employeeByGrp)) {
        user.setGender(employeeByGrp.getGender());
        user.setNationality(employeeByGrp.getNationality());
    }
    this.handleUserProfile(user, profileImage);
    user.setType(UserType.INTERNAL.getEnglishName());
    user.setIsInternal(Boolean.TRUE);
    user.setStatus(Status.INACTIVE);
    user.setIsActiveBefore(Boolean.FALSE);
    user.setConfirmationToken(UUID.randomUUID().toString());
    user.setIsMailSend(Boolean.TRUE);
    user.setRoles(this.handleUserRoles(request.getRoles()));
    return user;
}
```

```
2 usages  Mohammed Abdu
private void handleUserExpertises(CreateAdminUserRequest request, User user) {
    if (Objects.nonNull(request.getUsersExpertises()))
        expertisesService.createListOfExpertisesByUser(request.getUsersExpertises(), user);
}
```

```

Code Snippets

Roles & Expertises & Goals

- This method is part of the Roles Service Implementation class, responsible for creating a new role.
- It takes a Create Role Request as input, and before creating the role, it converts the English name to uppercase.
- The role is then created and returned as a Roles Response.

```
1 usage   Mohammed Abdu
@Override
public RolesResponse createNewRole(CreateRoleRequest request) {
    request.setNameEn(request.getNameEn().toUpperCase());
    return super.create(request, RolesResponse.class);
}
```

- This method is part of the Users Expertises Service class, dealing with the creation of users expertises.
- It takes a list of Users Expertises Request and a user as input.
- It filters the expertises requests to exclude those that already exist for the user.
- The filtered list is then saved to the repository after preparation.

```
1 usage   Mohammed Abdu
@Override
@Transactional
public void createListOfExpertisesByUser(List<UsersExpertisesRequest> usersExpertisesRequestList, User user) {
    List<UsersExpertises> existingUserExpertises = this.findAllByUser(user);
    if (Objects.nonNull(existingUserExpertises)) {
        usersExpertisesRequestList = usersExpertisesRequestList.stream()
                .filter(request -> existingUserExpertises.stream()
                        .noneMatch(existingExpertise ->
                                existingExpertise.getExpertises().getId().equals(request.getAreaOfExpertisesId())
                        )
                ).collect(Collectors.toList());
    }
    usersExpertisesRepository.saveAll(prepareListToSave(usersExpertisesRequestList, user));
}
```

- This method is part of Goals called Strategic Goals exist on Strategic Goals Service class, responsible for creating new strategic goals.
- It takes a Strategic Goals Request as input, creates a new strategic goal, and associates it with strategic directions.
- The strategic goal, along with its associated directions, is then returned as a Strategic Goals Response.

```
1 usage   Mohammed Abdu
@Override
@Transactional
public StrategicGoalsResponse createNewStrategicGoal(StrategicGoalsRequest request) {
    StrategicGoals strategicGoal = super.create(request);
    strategicGoalDirectionService.create(strategicGoal, request.getStrategicDirectionIds());
    return super.create(strategicGoal, StrategicGoalsResponse.class);
}
```

Code Snippets

Challenges

- **Mapping Challenges:**
Utilizes Model Mapper to map the request to a Challenges entity.

- **Handling Moderator:**
Associates a moderator (identified by moderator Id) with the challenge.

- **Setting Mandatory Data:**
Assigns default values for challenge attributes like status, urgency, survey status, etc.

- **Saving the Challenge:**
Saves the challenge in the Challenges Repository, obtaining the saved instance.

- **Handling Challenge Relations:**
Coordinates various relations associated with a challenge creation.

- **Attaching Hashtags:**
Connects the challenge with specified hashtags.

- **Attaching Expertises:**
Associates the challenge with specified expertises based on user requests.

- **Handling Media Relations:**
Manages document attachments and video links.

- **Handling User Invitations:**
Sends invitations to invited users and validators.

- **Attaching Documents:**
Links specified documents with the created challenge.

Attaching Video Links:
Associates specified video links with the challenge.

Handling Challenge Reminders:
Sets up reminders for the challenge, if provided.

Finally send invitation based on initial status.

```
Mohammed Abdu *
@Override
@Transactional
public ChallengesResponse create(ChallengesCreationRequest request, HttpServletRequest httpServletRequest) {
    // Map Challenges
    Challenges challenges = super.modelMapper.map(request, Challenges.class);
    // Add moderator
    this.handleModerator(request.getModeratorId(), challenges);
    // Set mandatory data
    this.handleMandatoryData(request, challenges);
    // Save Challenge
    Challenges savedChallenge = challengesRepository.save(challenges);
    // Save invited user to the challenge (userInvitationService)
    this.handleChallengesRelations(request, savedChallenge, httpServletRequest);
    // Return the response
    return modelMapper.map(savedChallenge, ChallengesResponse.class);
}
```

```
private void sendUsersInvitations(List<Long> invitedUsersIds, Challenges challenges, HttpServletRequest httpServletRequest) {
    if (Objects.nonNull(invitedUsersIds) && !invitedUsersIds.isEmpty())
        invitedUsersIds.forEach(userGrp ->
                userInvitationService.createUserInvitationChallengeInternal(userService.findUserByGrpNumber(userGrp), challenges, httpServletRequest));
}

1 usage  new *
private void sendValidatorsInvitations(List<Long> validatorsIds, Challenges challenges, HttpServletRequest httpServletRequest) {
    if (Objects.nonNull(validatorsIds) && !validatorsIds.isEmpty())
        validatorsService.create(challenges, userService.findByGrpNumberInAndStatusAndRolesNameEn(
                validatorsIds, SystemRoles.VALIDATOR.getEnglishName()), httpServletRequest);
}
```

```
@Override
@Transactional
public void createUserInvitationChallengeInternal(User user, Challenges challenges, HttpServletRequest httpServletRequest) {
    UserInvitation userInvitation = userInvitationRepository.save(
            this.generateUserChallengeInvitation(user, challenges, ChallengeInvitationType.ADMIN_USER, httpServletRequest));
    if (challenges.getStatus().equals(ChallengeStatus.URGENT)) {
        this.sendChallengeInvitationForUser(user, challenges, userInvitation);
        userInvitation.setId(userInvitation.getId());
        userInvitation.setStatus(UserInvitationStatus.SENT);
        userInvitationRepository.save(userInvitation);
    }
}

app.use(Notifications)
app.mount( rootContainer: '#app')
```

- Tried to follow Standard naming conventions for package names.

Overall description for the packages in our project:

- **dist** :
The distribution directory containing optimized code for deployment.

- **node_modules**:
Storage for external dependencies installed via npm.

- **public**:
Holds static assets like HTML files and images accessible directly.

- **src**:
Main source code directory containing components, views, services, etc. and this is the content:
  - **constants**: Contains constant values used throughout the application.
  - **dto**: Houses Data Transfer Objects defining data structures.
  - **locales**: Manages localization files for translations.
  - **model**: Defines data models and entities for the application.
  - **plugins**: Holds Vue.js plugins extending Vue instance functionality.
  - **router**: Manages Vue Router configurations for navigation.
  - **services**: Implements services for data fetching and business logic.
  - **store**: Stores Vuex store modules for state management.
  - **utils**: Contains utility functions for various purposes.

- **App.vue:**
Main Vue component defining the structure and behavior of the app.

- **main.ts:**
Main entry point where Vue is initialized, and the root component is mounted.

- **.env, .env.development, .env.production, .env.staging, .env.testing:**
Configuration files for different environments.

- **.eslintrc.cjs:**
ESLint configuration file for linting and static analysis.

- **.gitignore:**
Specifies files and directories to be ignored by Git.

- **.prettierrc.json:**
Prettier configuration file for code formatting.

- **env.d.ts:**
TypeScript declaration file for environment variables.
- **index.html:**
Main HTML file serving as the entry point for the Vue app.

- **package.json, package-lock.json:**
npm package configuration files defining project dependencies and scripts.

Admin User

- User List Snippets

Component Overview:

The provided Vue.js component, named 'UsersList,' is a comprehensive module for managing user information within the DubaiPolice system. It incorporates key functionalities such as user search, data export, user deletion confirmation, and detailed user views. The component is part of a larger Vue.js application that adheres to the copyright notice and legal considerations outlined in the comments.

Key Features:

User Search:

- Enables users to search for specific users based on various criteria such as group number, role, full name, expert level, status, and department.

Export to Excel:

- Facilitates the export of user data to an Excel file, enhancing data accessibility and sharing.

User Deletion Confirmation:

- Provides a mechanism for confirming user deletions, minimizing the risk of accidental deletions.

User Details View:

- Allows users to view detailed information about a specific user, enhancing the overall user management experience.

Pagination and Sorting:

- Implements pagination and sorting functionality to efficiently handle a large number of user records.

Dropdown Lists:

- Utilizes dropdown lists for selecting user roles, status, and other relevant parameters, contributing to a user-friendly interface.

LookupClientService:

- Interacts with the LookupClientService to retrieve user-related lookup data, such as department information and user roles.

UserClientService:

- Communicates with the UserClientService to perform actions like user deletion and fetching user records.

- User Deletion Snippets

```vue

    <v-card>
        <v-card-title class="headline">
            {{ $t('common.deletionTitle') }}
        </v-card-title>
        <v-card-text>{{ $t('common.deleteConfirmation') }}</v-card-text>
        <v-card-actions>
            <v-btn color="red darken-1" text @click="cancelWithoutDelete">{{
                $t('common.cancel')
            }}</v-btn>
            <v-btn color="green darken-1" text @click="confirmDeletion">{{
                $t('common.confirm')
            }}</v-btn>
        </v-card-actions>
    </v-card>
</template>

<script lang="ts">
import { defineComponent, PropType } from 'vue'

5+ usages  Mohammed Abdu *
export default defineComponent( options: {
    props: {
        dialog: Boolean as PropType<boolean>,
    },
    emits: ['cancel', 'delete'], // Declare the 'delete' event
    setup(props, { emit }) {
        1 usage  new *
        const cancelWithoutDelete = () => {
            emit('cancel')
        }

        1 usage  new *
        const confirmDeletion = () => {
            // Emit the 'delete' event when the "Confirm" button is clicked
            emit('delete')
        }

        return { cancelWithoutDelete, confirmDeletion }
    },
})
</script>
```

The 'DeleteConfirmation.vue' component is a Vue.js-based dialog component designed to confirm user deletion actions within the DubaiPolice application. This component provides a simple and intuitive confirmation dialog with options to cancel or proceed with the deletion.
